

Digital Mammography System Offers Optimal Imaging and Comfort

- MammoPad® breast cushion is used for every patient-guest to enhance comfort during a mammogram
- Siemens Tungsten tube technology reduces the radiation dose by more than 50%
- System features include a technique that senses breast thickness for a more comfortable compression
- Helps increase cancer detection rates with Computer Assisted Diagnosis (CAD) markers
- Excellent image quality
- Latest full-field detector technology based on amorphous selenium (a-SE)
- Increased detection of small and low contrast objects

“Screening mammography is our best tool for the early detection of breast cancer as it can detect an abnormality long before it can be felt. Digital mammography is the newest innovation on the market. It has been proven to be better than the previous method in three specific categories, while it is at least as good in all other categories. This system also includes an automatic second reading of each mammogram by a computer system.”

- Dr. Sally Gaglione, Community Hospital radiologist
